ENGR 4444  Engineering Measurements
4 Semester Credit Hours (3 Lecture Hours, 3 Lab Hours)
A very significant part of designing electronic instruments involves
selecting the appropriate physical devices to translate quantities to be
measured into voltages or currents that can be sensed with electronic
circuits. The range of sensors and transducers available will be studied
with examples from industry and medical instrumentation. The course
will explore in some detail the use of analog to digital (A/D) and digital to
analog (D/A) converters and their applications. Students will also learn
to use complete A/D-microprocessor-D/A systems since these are part
of nearly all instruments now. In this course students will learn to build
a complete instrument by combining analog and digital components
and using advanced algorithms. We will review the basic concepts from
analog electronics and real-time event driven programming one needs
to understand in order to construct such instruments and experiment
through a series of labs.
Prerequisite: (EEEN 2306 and 3315).
